

The first two studies were conducted in the United States and the third in the United Kingdom. The first study was a cross-sectional survey of 1,000 U.S. adults, 500 of whom were parents of children with autism. The second study was a longitudinal study of 100 U.S. adults, 50 of whom were parents of children with autism. The third study was a cross-sectional survey of 1,000 U.K. adults, 500 of whom were parents of children with autism. The results of the first two studies showed that parents of children with autism were more likely to be concerned about their child's future than parents of children without autism. The results of the third study showed that parents of children with autism were more likely to be concerned about their child's future than parents of children without autism.
